

- (a) deployment: the stream grows, the window slides, the oldest unit falls out
softmax window: last M units (60 s)

identical context construction: every supervised branch below sees exactly the windowed cache + from-frame-0 linear state + forked suffix it will see when deployed above

- (b) training: one episode forwarded once, B branches at random anchors
trunk: the episode's full history stream, forwarded once under the SWA mask
